

## **Successful Scotsturf for Etesia**

“The Scotsturf organisers put on a really good show”, says Etesia’s UK Sales Manager, Colin Plumb.

“The quality of visitors was excellent and response was good – particularly for our range of Hydro 124 ride-on rotaries.”

The main benefit of these 124cm mowers is Etesia’s unique cutting edge and collecting system which combines direct rear-ejection and integrated collection to ensure high productivity without clogging, even in wet or long grass. This high output machine can out-perform most other similar mowers and, depending on conditions, has a top working speed of 16km/h.

Two models make up the Hydro 124 range – both have powerful Lombardini water cooled diesel engines plus easy-to-operate forward and reverse hydrostatic drive, cutting and collecting in both directions. Their 600-litre grassboxes hold more than 100kg of grass and are packed to capacity every time. Low decibel levels make these Etesia mowers ideal for use on noise sensitive sites.

Top of the range is the Hydro 124DN with diff lock and front PTO – its high lift emptying allows clippings to be deposited in to a truck or trailer. A wide range of turf care and other attachments are available for this machine.

For professionals who do not require the high-lift collector, there is the Hydro 124DS – its collector is hydraulically emptied at ground level from the driving position.
